A2 Treatment conditions

All treatments are introduced by the following two passages:

Please read the following information.

There has been some discussion about the relationship between international trade and protection of the environment.

A2.1 Treatment 1 – T1

There is a lot of evidence that, overall, the effects of international trade on environmental protection both in [INSERT RESPONDENT'S COUNTRY] and in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades are positive.

International trade creates wealth that can be used for better environmental protection in [INSERT RESPONDENT'S COUNTRY] as well as in the countries with whom [INSERT RESPONDENT'S COUNTRY] trades. International trade also promotes the development and spread of environmentally friendly technologies whose use reduces pollution and waste both in [INSERT RESPONDENT'S COUNTRY] and its trade partner countries.

In brief, international trade supports environmental protection efforts and improves environmental conditions both in [INSERT RESPONDENT'S COUNTRY] and in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades.

Please take a look at the following illustration.

A2.2 Treatment 2 – T2

There is a lot of evidence that, overall, the effects of international trade on environmental protection both in [INSERT RESPONDENT'S COUNTRY] and in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades are negative.

The production and consumption of goods that are traded internationally, such as machines, steel, cement, paper, chemicals, food, metals, cars, or electronic devices damage the environment. Increased economic competition through international trade also puts pressure on policymakers to lower environmental standards both in [INSERT RESPONDENT'S COUNTRY] and in countries with whom [INSERT RESPONDENT'S COUNTRY] trades, so as to maintain the competitiveness of exporting firms.

In brief, international trade undermines environmental protection efforts and worsens environmental conditions both in [INSERT RESPONDENT'S COUNTRY] and in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades.

Please take a look at the following illustration.

A2.3 Treatment 3 – T3

There is a lot of evidence that, overall, the effects of international trade on environmental protection in [INSERT RESPONDENT'S COUNTRY] are positive, but that the effects on environmental protection in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades are negative.

On the one hand, international trade creates wealth that can be used for better environmental protection in [INSERT RESPONDENT'S COUNTRY]. International trade also promotes the development and spread of environmentally friendly technologies whose use reduces pollution and waste in [INSERT RESPONDENT'S COUNTRY].

On the other hand, the production of goods such as machines, steel, cement, paper, chemicals, food, metals, cars, or electronic devices, which are exported from other countries to [INSERT RESPONDENT'S COUNTRY], damages the environment in those other countries. Increased economic competition through international trade also puts pressure on policymakers in those countries to lower their environmental standards, so as to maintain the competitiveness of exporting firms.

In brief, international trade supports environmental protection efforts and improves environmental conditions in [INSERT RESPONDENT'S COUNTRY]. But it undermines environmental protection efforts and worsens environmental conditions in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades.

Please take a look at the following illustration.

A3 Treatment 4 – T4

There is a lot of evidence that, overall, the effects of international trade on environmental protection in [INSERT RESPONDENT'S COUNTRY] are negative, but that the effects on environmental protection in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades are positive.

On the one hand, the production of goods such as machines, steel, cement, paper, chemicals, food, metals, cars, or electronic devices, which are exported from [INSERT RESPONDENT'S COUNTRY] to other countries, damages the environment in [INSERT RESPONDENT'S COUNTRY]. Increased economic competition through international trade also puts pressure on policymakers in [INSERT RESPONDENT'S COUNTRY] to lower environmental standards, so as to maintain the competitiveness of exporting firms.

On the other hand, in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades, international trade creates wealth that can be used for better environmental protection. International trade also promotes the development and spread of environmentally friendly technologies whose use reduces pollution and waste in those countries.

In brief, international trade undermines environmental protection efforts and worsens environmental conditions in [INSERT RESPONDENT'S COUNTRY], but supports environmental protection efforts and improves environmental conditions in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades.

Table A24: **Heterogeneous Treatment Effects – Education**

A6.2 Additional Evidence by Country

Figure A1: **Treatment effects on Trade Restrictions: economic by country.** Notes: 1) Ranges represent 95% confidence intervals; dots represent unstandardised coefficients from a multinomial logistic regression. 3) The solid grey vertical line represents marks 1, ergo a null-effect.

A7 Treatment 5

Our empirical setup also included a fifth treatment condition. This treatment repeated the information of treatment 3 (hurt abroad) and additionally emphasised that the environmental consequences abroad are stronger.

Treatment 5 Wording

There is a lot of evidence that, overall, the effects of international trade on environmental protection in [INSERT RESPONDENT'S COUNTRY] are positive, but that the effects on environmental protection in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades are negative.

On the one hand, international trade creates wealth that can be used for better environmental protection in [INSERT RESPONDENT'S COUNTRY]. International trade also promotes the development and spread of environmentally friendly technologies whose use reduces pollution and waste in [INSERT RESPONDENT'S COUNTRY].

On the other hand, increasingly tough environmental protection standards in [INSERT RESPONDENT'S COUNTRY] have pushed highly polluting industrial production out of [INSERT RESPONDENT'S COUNTRY] and into other countries that have weaker environmental protection standards. Such goods include for example machines, steel, cement, paper, chemicals, food, metals, cars, or electronic devices. These goods are then exported from other countries to [INSERT RESPONDENT'S COUNTRY]. As a result, the environment in [INSERT RESPONDENT'S COUNTRY] has become cleaner while consumers in [INSERT RESPONDENT'S COUNTRY] are still able to buy all the goods they want. But environmental conditions in countries with whom [INSERT RESPONDENT'S COUNTRY] trades have become worse, because the environmental damage from producing many goods that people in [INSERT RESPONDENT'S COUNTRY] consume now takes place in other countries.

In brief, international trade supports environmental protection efforts and helps improve environmental conditions in [INSERT RESPONDENT'S COUNTRY]. But it does so at the expense of environmental protection efforts in other countries with whom [INSERT RESPONDENT'S COUNTRY] trades.

Please take a look at the following illustration.

Results

By and large, we do not observe any systematic changes in the results of T3 when combining Treatment 3 and Treatment 5. Only the coefficient for T3 and the response *Don't know* in Table A26 now reaches statistical significance. However, this is entirely a function of the smaller standard errors. The point estimate remains essentially the same.
